

Connecting our two systems.

A plan to link the Curriculum Generator and the AGI Online Dashboard so a new course can go from idea to students with one click — not dozens of uploads.

PREPARED FOR

Leadership & Product stakeholders

PREPARED BY

Vidit Bhatnagar

STATUS

For your review & input

Two systems. Doing their jobs beautifully.

We built each tool with a specific purpose. They both work. They just don't talk to each other yet.

SYSTEM 1

Curriculum Generator

Turns an SME submission into a full, accreditation-ready curriculum using AI.

- 13 structured steps, from program foundation to final exam
- Generates module outcomes, reading lists, case studies
- Builds quizzes, lesson plans, assignments and PowerPoints
- Outputs a complete course package as documents

SYSTEM 2

AGI Online Dashboard

Delivers courses to students. Where teaching and learning actually happen.

- Admin area to add courses, modules, videos and documents
- Quizzes and final exams graded automatically
- Live classes, recordings, attendance and feedback
- Certificates issued to students who pass

— THE GAP BETWEEN THEM —

Right now, a human carries the curriculum across the gap.

An admin downloads every document from the Generator, then copies, pastes, re-types, re-attaches and re-uploads everything into the LMS — module by module, quiz by quiz, file by file.

What the current handoff costs us.

Every curriculum we publish the manual way burns hours, invites errors, and makes the people closest to students the slowest part of the whole system.

4–6 hrs

Per course, manually

Copying a generated curriculum into the LMS takes half a working day even when nothing goes wrong.

98

Files to place correctly

The Maths Certification alone produced 98 slide decks. Each one must be attached to the right lesson in the right module.

13×

Chances to mis-map

13 steps, each a separate document. Wrong upload, wrong module, wrong quiz — mistakes that reach students.

0

Versioning or history

When a curriculum is regenerated, no one knows what changed. The LMS can only be overwritten blindly.

The bigger risk: everything we carefully generate — Bloom levels, marking schemes, learning outcome links — gets flattened when we paste it into the LMS. We lose the intelligence the Generator created.

One button. "Publish to LMS."

The admin finishes generating. They click a button. The course appears in the LMS, fully structured, awaiting their review. No downloads. No re-typing. No lost data.

TODAY

Manual relay race

- Download 13 documents + 1 ZIP file
- Open the LMS admin, create a new course
- Re-type title, description, hours
- Create each module by hand
- Upload each slide deck to the right lesson
- Rebuild every quiz question manually
- Re-enter the final exam, one question at a time
- Hope nothing was mis-labelled

AFTER

One click

- Open the finished curriculum
- Click **Publish to LMS**
- Review the preview — edit title or slug if needed
- Confirm
- The LMS creates the course, all modules, lessons, slide decks, quizzes and the final exam — instantly, in a protected staging area
- Admin reviews it on screen and clicks **Go Live** when happy

Why this matters

We stop paying a human tax on every course. The admin becomes a reviewer instead of a data-entry clerk. Students get new courses faster. And the quality we built into the Generator finally reaches the LMS intact.

The journey of a generated curriculum.

Five simple steps. The first three happen in the tools we already use. The last two are new.

1

Generate the curriculum, as usual

SME submits their form. The Generator runs through its 13 steps and produces the full course package. Nothing changes here.

2

Review inside the Generator, as usual

Admin checks the output step by step, edits anything that needs polishing, and approves the final exam. Again, unchanged.

3

Click "Publish to LMS" — the new button

A clean preview opens: course name, slug, module count, lesson count, quiz count, final exam summary. Admin can adjust the name or slug, then confirms.

4

The course lands in an LMS staging area

The LMS receives everything — modules, lessons, slide decks, quizzes, the final exam — and creates a *sandbox course*. Students cannot see it yet.

5

Admin reviews & promotes it live

Admin opens the sandbox course in the LMS, scrolls through it, tweaks anything if they want, and clicks **Go Live**. Students can now enrol.

Important: the admin keeps final control. Nothing reaches students without a human approval, just like today. We're removing the busy-work, not the judgement.

We weighed three ways to connect them.

Before settling on the recommendation, here's the full comparison of the three paths we looked at.

APPROACH	WHAT IT WOULD LOOK LIKE	ADMIN EFFORT	QUALITY PRESERVED
Option A Upload one file per step	Admin uploads each of the 13 documents into the LMS, where the system tries to read them and fill the right fields.	HIGH	LOW
Option B One big package download then upload	Generator makes one big export file. Admin downloads it, uploads it to the LMS, which unpacks and builds the course.	MEDIUM	HIGH
Option C CHOSEN Direct publish with safety net	The two systems talk to each other. One click publishes into an LMS staging area. Admin reviews and goes live.	LOW	HIGH

Why not Option A?

Asking the LMS to read 13 documents and reconstruct the structure is fragile. We'd lose the precision we carefully built in the Generator — the learning-outcome links, the mark allocations, the quiz metadata — all of it flattens when it passes through a Word document

Why not Option B?

It's a real step forward, but the download-then-upload dance is friction we don't need. Both systems are ours. We can let them talk directly and still keep the review step that Option B offered.

Why Option C wins

Lowest effort, highest quality preserved, and the human review stays in place. We also keep the door open to do Option B later (for example, if we ever publish to a third-party LMS like Moodle) — the underlying format works for both.

Nothing reaches students without a human saying yes.

The publish button doesn't push content live. It pushes it into a staging area that only admins can see — then admins promote it to students when they're ready.

What admins can do in the sandbox

- Preview every module, lesson and slide deck
- Edit the course name, description, or any module title
- Re-order modules or lessons
- Spot-check quiz answers and the final exam
- Replace or remove any attached file
- Add live class schedules before going live

What happens if we regenerate later

- Re-publishing the same curriculum updates the existing sandbox — never duplicates
- If the course is already live, a new sandbox is made so admin can compare changes side-by-side before updating students
- Admin edits made inside the LMS are protected — re-publish shows a clear diff and asks what to keep

How each piece finds its home.

Each part of the generated curriculum lands in exactly the right place inside the LMS. Nothing is lost, nothing is guessed.

Program Foundation

Course name, description, duration

**Course basics**

Title, slug, type, description

Module & Outcome plan

Modules, learning outcomes, Bloom levels

**Modules**

With learning outcomes attached for teachers

Reading lists & sources

Articles, book chapters, web links

**Module documents**

Linked or uploaded files under each module

Formative assessments

Short quizzes for each module

**Module quizzes**

Auto-graded MCQs, time limits, pass marks

Case studies

Applied scenarios linked to modules

**Module resources**

Downloadable case study documents

Glossary

Key terms and definitions

**Course resources**

Reference document students can browse

Lesson plans

Teacher notes, timing, activities

**Instructor notes**

Attached per lesson, hidden from students

Slide decks (PowerPoints)

One per lesson

**Lesson materials**

Downloadable / viewable on each lesson page

Assignment packs

Briefs, rubrics, submission guides

Module assignments

Teacher-graded work for students

Summative exam

Final exam with sections and marking scheme

Final examination

With sections, timing and pass marks set

Built and tested in five short phases.

We'd deliver this incrementally so we can test each piece as we go, and stop or change course at any point without a wasted build.

PHASE 1**Foundation & plumbing**

Agree the shape of the information that travels between systems. Set up the secure connection between them.

~ 1 week**PHASE 2****Course basics & structure**

Publish a course with its modules and final exam from end to end. First real round-trip.

~ 1 week**PHASE 3****Attachments & slide decks**

Slide decks, lesson plans, case studies, glossary and reading lists all flow across automatically.

~ 1 week**PHASE 4****Quizzes & assignments**

Formative quizzes per module plus assignment packs, with MCQ auto-grading plugged in.

~ 1 week**PHASE 5****The button & the polish**

Publish button in the Generator, sandbox review screen in the LMS, re-publish with side-by-side comparison.

~ 4 days

Total: roughly four to five weeks of focused work, with something testable at the end of each phase. We'd start on the Maths Certification as the first real course to validate the whole pipeline.

What we'd love your input on.

This plan reflects our best thinking. Before we start building, these are the open questions where your perspective shapes the answer.

QUESTION 1

When a curriculum is *re-published* after edits, should the LMS keep admin changes that were made inside it, or always prefer the freshly generated version? Where does "source of truth" sit?

QUESTION 2

For slide decks, would you prefer students download each PowerPoint, view it in-browser, or should we eventually turn them into narrated videos? Today we'd start with in-browser viewing — is that enough?

QUESTION 3

The Generator produces some things the LMS doesn't have a home for yet (glossary, learning-outcome links, assignment rubrics). Do you want those student-facing, instructor-only, or skipped for now?

QUESTION 4

Should regenerating a curriculum ever go *straight to live* — bypassing sandbox — for a course that's already been approved once? (We'd default to no, but interested in your view.)

QUESTION 5

Beyond publishing *into* the LMS, would you want information flowing back? For example: seeing pass rates per module inside the Generator, so the SME can see which parts of their curriculum are working?

Next step

We'd love 30 minutes of your time to walk through this in person, hear your answers, and agree on start dates. Reply to this doc or grab a slot on the shared calendar.

THANK YOU

Let's close the gap.

Our generator builds world-class curricula. Our dashboard delivers them to students brilliantly. The only thing left is the quiet, one-click bridge that connects the two.
